

PT Agincourt Resources is fully aware that nature and biodiversity conservation is an integrated part of the business.

At the end of 2021, PT Agincourt Resources was awarded by the Directorate General of KSDAE at the Ministry of Environment for being actively involved in the process of taking care and releasing of Sri Nabila, a young Sumatran tigress that was released in Gunung Leuser National Park, Gayo Lues, Aceh, approximately 500 km away from Martabe gold mine.

Sri Nabila's Long Way Home

A Young Sumatran Tigress Released Back to Nature

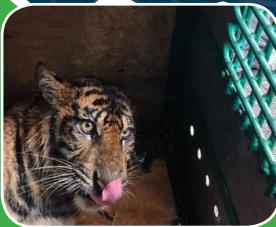

Agincourt Resources' Serious Effort In Preserving Biodiversity

The Role of Apex Predator in the Sumatra's Rain Forest Ecosystem

The Sumatran tiger is the apex predator in the food chain of Sumatra's forest ecosystem. Tigers maintain the balance between prey species and the rest of the system, they control prey populations and provide ecological stability. Tigers have a low population and are vulnerable to hunting, either hunting for predators themselves or hunting for prey animals.

The scarcity of the prey animal can result an imminent threat to the predator's food source, as well as the extinction of apex predators (tiger, leopard or other species at the top of the food chain) may cause overpopulation of the species below apex predator's rank in the food chain. The excessive hunting of any species will cause instability in the entire ecosystem. In principle, apex predators increase the stability of the ecosystem by properly balancing their prey populations.

May 20, 2020
'Sri Nabilla' spotted by the villagers wandering around in their settlements and preyed livestocks in Tapus Sipagabu Village, Aek Bilah District, South Tapanuli Regency, North Sumatra.

August 24, 2020
A team from North Sumatra Natural Resources Conservation dispatched to the area and evacuated the young tigress to the Barumun Nagari Wildlife Sanctuary, Batu Nanggar Village, Aek Godang, Batang Onang District, North Padang Lawas Regency. The tigress was at good, aggressive and healthy condition at the time she got caught.

Three months treated and taken care in the sanctuary, the tigress reached its good health condition. Hence, it was the perfect time to release it into its natural habitat.

November 1, 2020
Guarded by a team from North Sumatra Natural Resources Conservation and a medical team, Sri Nabilla started the long journey to her new home, 500 km away to the north. It is the Leuser National Park area, Gayo Lues, Aceh.

November 3, 2020
Hooked with a releasing cage under the belly of a helicopter provided by PT Agincourt Resources from a nearby airport to her new home, Sri Nabilla arrived at the location, safe and sound. The release cage door opened and the amazing creature stepped out into the wild.

IMMINENT THREATS FOR SUMATRAN TIGER

1. Poaching. The trade of tiger's body parts or intact tiger body.
2. Habitat loss. The expansion of oil palm plantations was the primary driver of Sumatran tiger habitat.
3. Conflict with human
4. Excessive hunts of its prey species
5. Human direct hunt on tiger

SUMATRAN TIGER FACTS

1. The smallest tiger species in the world. The fur of the Sumatran Tiger is the darkest and has the thickest and longest mane among other tigers in the world.
2. Sumatran Tiger loves durian.
3. Sumatran Tiger have membranes between its fingers that make them a good swimmer and also a very skilful tree climber.
4. Sumatran Tiger have membranes between its fingers that make them a good swimmer and also a very skilful tree climber.
